THE MEZO BUILDATHON · ACCESS AND DISTRIBUTION

Liqvera.

Market reports you can verify.

Public BTC market evidence. Exact calculations.
MUSD payment integration on Mezo Mainnet.

Existing project · pre-event baseline

Mezo Mainnet · 31612

THE PROBLEM

A price is not the depth behind an order.

Missing context

A headline price omits available liquidity and the effect of order size.

Fragile evidence

A screenshot does not carry the inputs needed to reproduce its calculations.

Unclear assumptions

Users need capture time, requested quantity, quality checks and explicit limits.

Keep the report and its evidence together.

Initial audience hypothesis: analysts, developers and technically experienced report users. Demand and willingness to pay still need validation.

HOW IT WORKS

Capture once.
Check independently.

Public snapshot → Exact calculation → JSON + evidence ZIP → Offline verification

Observe

Public Hyperliquid BTC perpetual order-book data, captured with source metadata.

Calculate

Filled quantity, notional, VWAP, worst price and price impact for a hypothetical sweep.

Reproduce

Validate bundle integrity and recompute results without contacting the service.

No exchange trading. No fees, funding or net P&L calculation. Integrity checks do not independently authenticate the exchange.

WHY MUSD

Access payments for verifiable information.

Payment and delivery

x402 MUSD payment integration configured for Mezo Mainnet. Settlement and entitlement bind to exact report and bundle hashes.

Useful integration

A concrete digital service that accepts MUSD, with evidence recipients can retain and inspect after delivery.

Historical paid delivery demonstrated.

Current status: the API stays available when external payment authority is invalid. New payments remain disabled until valid authority is restored. No successful Mainnet paid delivery is claimed.

WHAT TO INSPECT TODAY

A report you can take away and check.

1. Open the wallet-free historical preview at liqvera.site.
2. Inspect its capture timestamp, order quantity and depth results.
3. Download the preserved report and evidence ZIP.
4. Run the verifier matching that artifact's version.

The historical preview is labelled with its original capture time. It is not a fresh capture. Published historical bytes and their verifier contract remain unchanged by the current namespace migration.

BUILT AND CHECKED

A complete product, with scoped evidence.

1,167

Python tests passed

Plus 85 subtests in the recorded full local run.

8

Images audited

Independent advisory sources and explicit dispositions for remaining raw matches.

61

Gateway tests passed

Follow-up startup fix checked with disposable PostgreSQL.

Full suite and image audit: source 76b63ec. Gateway follow-up: c7b19bc. These are local checks, not complete live acceptance. Historical acceptance: 9 PASS, 21 NOT_RUN. All seven production containers now use audited images. The October 12 public-data report reproduces offline. New payments remain gated.

Make MUSD access useful. Make the evidence portable.

Wave 1 · Oct 26

Ship a scoped MUSD-access improvement and demonstrate the working supported-network flow.

Wave 2 · Nov 15

Use feedback to improve discovery and recovery; show meaningful additional progress.

After the event

Pilot with prospective users, measure repeat usage and validate willingness to pay.

Liqvera — Market reports you can verify.
