Liqvera.

Market reports
you can verify.

BTC market evidence from Hyperliquid and Mezo.
Exact calculations. MUSD payments on Testnet.

Existing project · October 23 update

Mezo Testnet · 31611

liqvera.site · github.com/Dimkox/liqvera

THE PROBLEM

A price is not the depth behind an order.

Missing context

A headline price omits available liquidity and the effect of order size.

Fragile evidence

A screenshot does not carry the inputs needed to reproduce its calculations.

Unclear assumptions

Users need capture time, requested quantity, quality checks and explicit limits.

Keep the report and its evidence together.

Initial audience hypothesis: analysts, developers and technically experienced report users. Demand and willingness to pay still need validation.

HOW IT WORKS

Capture once.
Check independently.

Public snapshot → Exact calculation → JSON + evidence ZIP → Offline verification

Observe

Public Hyperliquid BTC perpetual depth and fixed-block Mezo MUSD/BTC pool state.

Calculate

Filled quantity, notional, VWAP, worst price and price impact for a hypothetical sweep.

Reproduce

Validate bundle integrity and recompute results without contacting the service.

Read-only analysis. Mezo pool fee included; gas, Hyperliquid fees and funding excluded. Integrity checks do not prove exchange or chain authenticity.

MEZO TESTNET · DEPLOYED OCTOBER 23

Mezo data.
MUSD access.

DEX evidence

MUSD/BTC reserves and the actual pool fee, read at one fixed block. Pool and Router quotes agree with exact offline arithmetic.

Payment and delivery

0.01 test MUSD through x402. Existing payment guards bind access to report and bundle hashes; verified historical transfers remain linked.

Mezo DEX vs Hyperliquid · block 16321216

Portable raw calls and verified ABIs. Mezo spot MUSD and Hyperliquid perpetual USD differ; comparison excludes gas, Hyperliquid fees and funding. No own registry contract or new signed-payment acceptance is claimed.

WHAT TO INSPECT TODAY

A report you can take away and check.

1. Open the wallet-free historical preview at liqvera.site.
2. Inspect its capture timestamp, order quantity and depth results.
3. Download the preserved report and evidence ZIP.
4. Run the verifier matching that artifact's version.

The October 23 SELL 1 BTC preview contains Mezo block 16321216 and an exact Pool/Router comparison. Both immutable asset URLs match their pins; the downloaded ZIP reproduces without networking.

BUILT AND CHECKED

A complete product, with scoped evidence.

1,021

Python tests passed

Plus 85 subtests in the recorded full local run.

4

Runtime images deployed

Fresh image-bound scans; inherited runtime checks explicitly hash-bound.

74 + 107

Gateway + browser tests

Merchant checkout verified with disposable PostgreSQL and browser tests.

Exact-head CI e80474e passed 1,021 Python tests and 85 subtests; two live tests were deselected. Gateway: 74 local passes with disposable PostgreSQL; hosted CI skipped 13 database cases. Browser: 107 passes. Seven services healthy. Historical payments used; fresh signed acceptance deferred by the owner.

Make MUSD access useful.
Make the evidence portable.

Wave 1 · Oct 26

Ship a scoped MUSD-access improvement and demonstrate the working supported-network flow.

Wave 2 · Nov 15

Use feedback to improve discovery and recovery; show meaningful additional progress.

After the event

Pilot with prospective users, measure repeat usage and validate willingness to pay.
